

"QUALITY IS THE COMMON LANGUAGES OF SOUND BUSINESS."

CELİKERLER®
ÇELİK KONSTRÜKSİYON İNŞAAT SAN. TİC. LTD. ŞTİ.

since 1884

since 1884

ABOUT US

Çelikerler began as a hot blacksmith in Bartın Kumluca in 1844.

In 2003, it was incorporated as,

"**ÇELİKERLER ÇELİK KONSTRÜKSİYON İNŞ. SAN. TİC. LTD. ŞTİ**".

Today, Çelikerler combines its past experience with modern technology to manufacture steel constructions in its **25,000 m² production facilities**.

With its wide machinery and qualified technical team, Çelikerler closely follows domestic and international developments in the sector and provides world-class quality and service in its field.

Çelikerler company has expanded its quality and service boundaries in **mosque structures, prefabricated houses, steel construction houses, heavy industrial structures, containers, construction site structures** and has realized many successful projects in Turkey and abroad.

The company has adopted customer satisfaction as a principle and expands its product range without compromising on quality.

Çelikerler prioritizes people in every project and adheres to occupational safety rules in its manufacturing and assembly sites.

The company will continue to execute its projects while adding new achievements.

VISION

Construction sector to design, manufacture and construct high value-added, innovative, reliable, environmentally friendly, cost effective, high quality steel and prefabricated structures.

MISSION

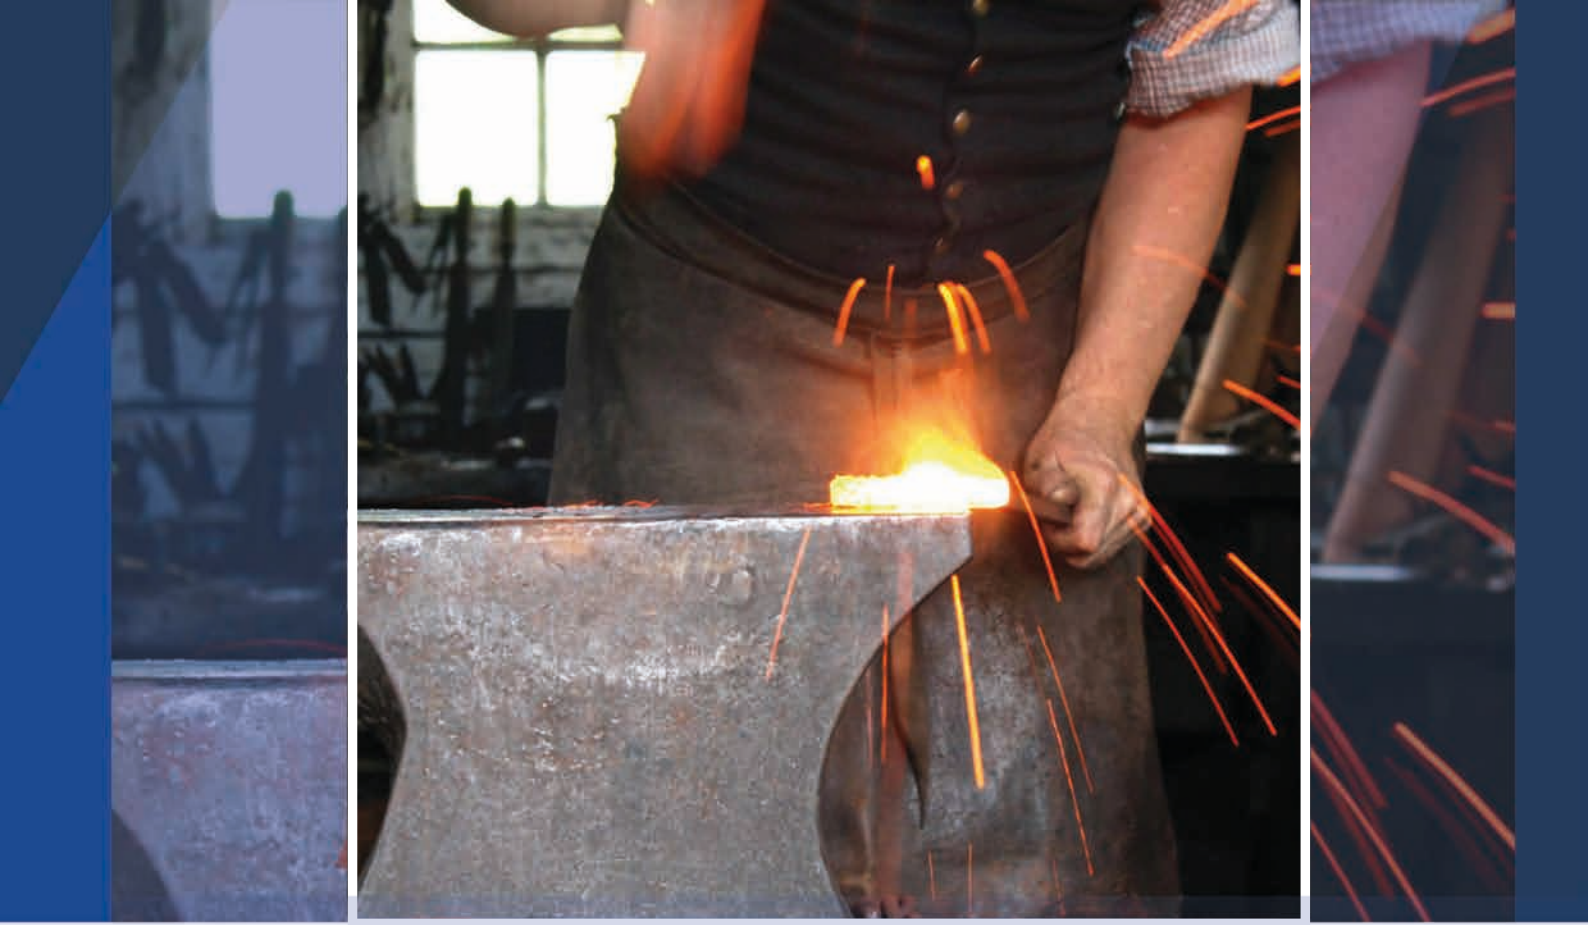

Our goal is to become a leading producer of steel construction and prefabricated structures in the construction sector, recognized globally and ranked among the top 100 companies in the Turkish industrial sector.

CERTIFICATES

“ QUALITY, ROBUST COMMON LANGUAGE OF BUSINESS.”

ÇELİKLERLER QUALITY AND ASSURANCE operates in 12 countries worldwide.

CONSTRUCTION PROCESS

1-DESIGN

Our technical staff designs and performs static calculations to ensure efficient, safe, comfortable, and effective human use. We select aesthetic and cost-effective products while considering the wishes of our customers. We use advanced software programs to create models and drawings.

2-OFFER AND SALE

After the site survey and determination of the location, the data generated as a result of static calculations and architectural studies are entered into the cost analysis. The proposal and design presentations resulting from the analysis are shared with our clients.

3-MANUFACTURING

After the design of building application projects and manufacturing detail drawings, it is manufactured with advanced infrastructure and automation-based machines in accordance with international standards, without compromising on occupational health and safety, by senior employees, each of whom has a certificate in their field.

4-QUALITY CONTROL

Each part used in the building and requiring fabrication, as well as each material supplied by external suppliers, is controlled in accordance with the quality standards, technical drawing and usage requirements of the material. The measurement and quality control process is carried out by experienced quality control engineers using precision control equipment that is periodically calibrated according to the type, dimensions and tolerances of the material.

" Our basic principle is to satisfy our customers and related parties. Our most important goal is to satisfy our customers by ensuring that our products and services have the features our customers want, are cost-effective and delivered on time, and to progress in line with our quality targets. "

RAMAZAN ÇELİKER
Chairman of the Board of Directors

5-SHIPMENT

All materials required for the assembly of the structure are individually packaged and prepared according to the road conditions of the region where the shipment will be made, concerning the prepared assembly list, assembly drawings, and construction technical specifications. Once the quality control engineers approve the packages' ability to withstand road conditions, they are then prioritized and transferred to the appropriate vehicle for transportation in accordance with the assembly order.

6-ASSEMBLY

Before starting the assembly, a risk analysis is created for the area where the assembly will be made by the occupational health and safety specialist in our company. As a result of the analysis, Environmental and Occupational Health and Safety precautions are taken and the assembly is started. Depending on the size of the project, the assembly is carried out under the control of experienced site chiefs and teams; in accordance with the assembly instructions, assembly drawings, and technical specifications with the help of advanced construction machinery and equipment.

7-DELIVERY

After the assembly is completed with all items, the delivery team assigned from the factory, together with the quality control engineer and the building owner, check the compliance of the building with the architectural plans, assembly plans, and the contract. After the control, the building owner signs the delivery receipt and takes delivery of the building. The building warranty period starts at this point.
